Settings IA skeleton

Defaults, Stellar network selection, and email opt-ins in familiar list rows.

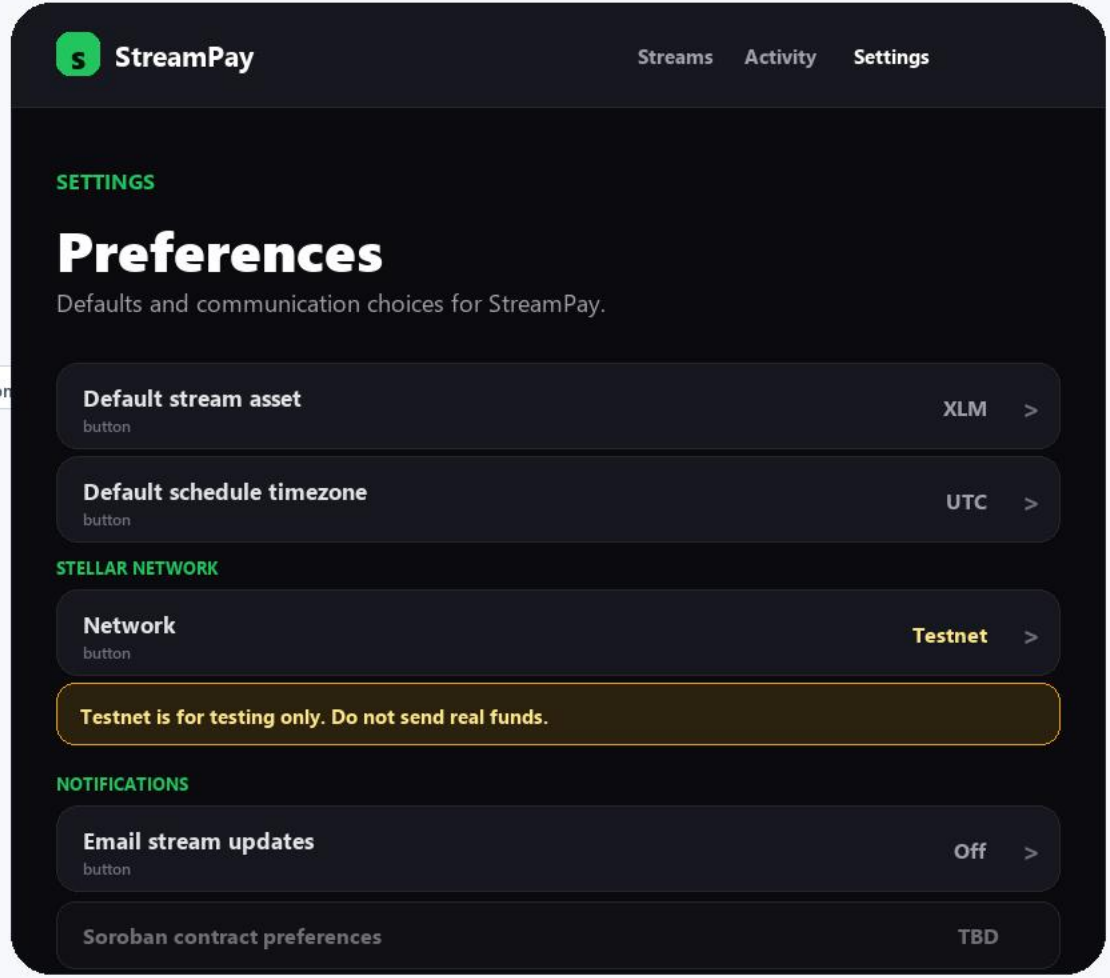
iOS-like rows | network caution modal | row role annotation | email opt-ins | Soroban TBD

Scope one-pager

v1 Defaults, network selector skeleton, notification opt-ins.

Later Preference persistence, deeper sheets, contract-specific settings.

Not code No settings route or backend user prefs implementation.



Figma annotations

- Every row is a button or link.
- Focus order follows visual order.
- Network row opens modal.
- Email switches need on/off state.
- Soroban switches stay TBD.

Not in scope: settings route implementation, backend user preferences, or committed Soroban/contract switches.

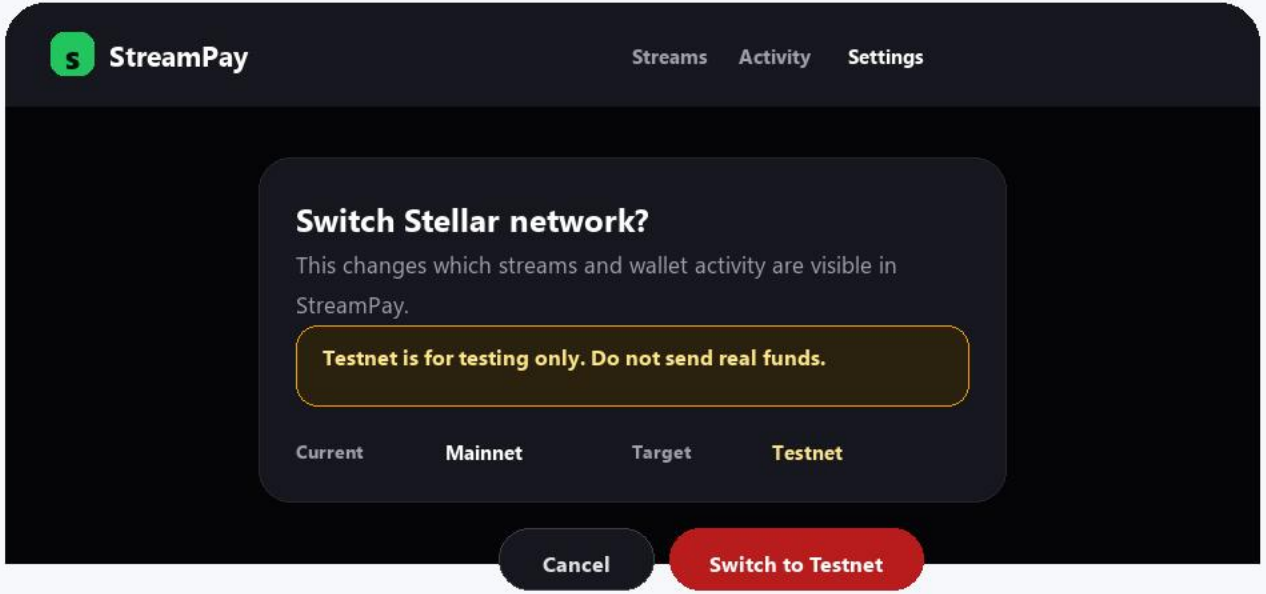
Network switch requires reconfirmation

Switching Stellar networks changes which streams, wallet activity, and test data are visible. Treat it as a caution action, not a casual toggle.

current + target network | prominent testnet warning | cancel path | focus trap | returns focus to row

A11y modal notes

- Esc closes modal.
- Focus trapped while open.
- Confirm copy names target.
- Warning is text, not only color.



Product TBD

- Persist per user, wallet, or device?
- Email opt-ins before backend prefs?
- Any Soroban switches in v1?

Design crit required: one product stakeholder + one engineering stakeholder. Full settings depth can follow in a later sprint.
